

# Directions for FSM

**Jay Bhagwan**

Executive Manager

Water Research Commission

# Introduction

- Sanitation is :
  - Improving human health
  - Improving public health
  - Improving environmental health
- Breaking the transmission of faeco-oral and water related diseases

Prof GP Hadley  
Department of Paediatric Surgery  
Nelson R Mandela School of Medicine

# What people want:

- Convenience – ‘flush and forget’
- Status
- Privacy
- dignity

# Human Excreta

**Faeces and urine**

***The major global  
environmental  
pollutant***

***And possibly.....KILLER***

# Introduction

**“Water should not be judged by its history, but by its quality”**

**Dr Lucas van Vuuren , one of the pioneers of the Windhoek water reclamation system.**

**“Is about the the toilet >wastewater>pollution  
nexus - Sunita Narain”**

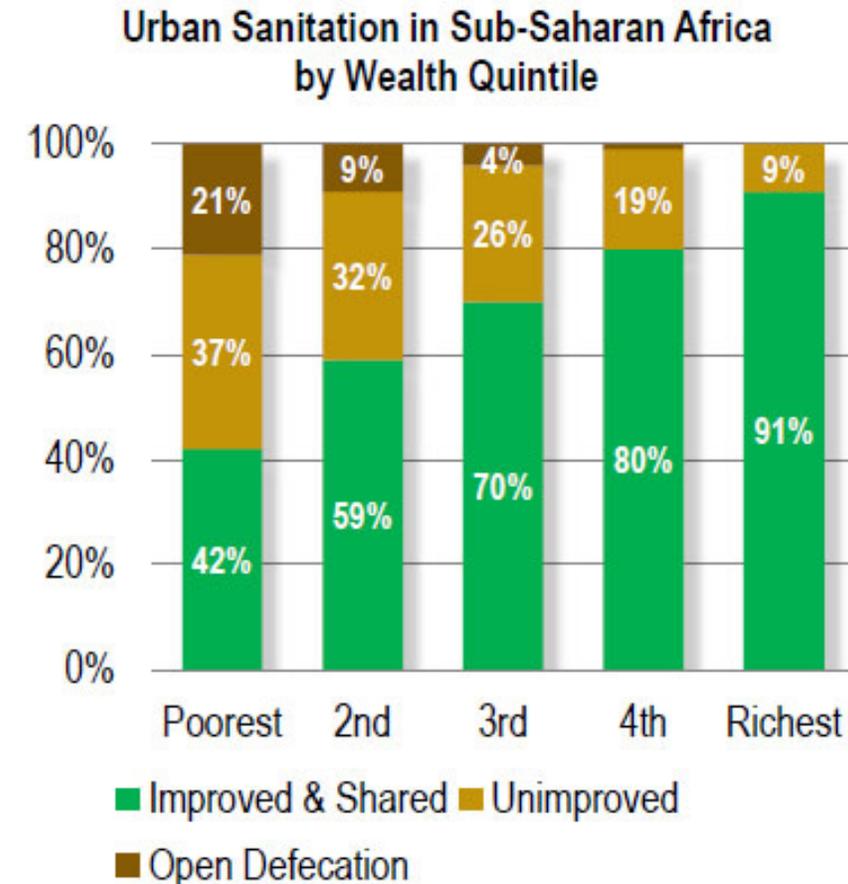

# Why is Fecal Sludge Management Important?

- **Most urban sanitation access is via on-site systems:** <10% of urban Africa has sewer access
- **Virtually all poor people use on-site sanitation** or have no access to improved sanitation
- **Most urban on-site sanitation is not linked to a transport and treatment system,** resulting in gross contamination of the environment

60%

70%

More than 60% Off the grid

# Challenges

## FSM is 'invisible' to policy-makers

- Sewerage widely regarded as 'proper' solution
- FSM seen as stop-gap solution for slums and left to informal and private service providers
- Very little information available

## FSM is generally poor

- Many toilets hard to empty
- Widespread manual emptying
- Unregulated vacuum tankers, illegal dumping
- Treatment facilities generally lacking

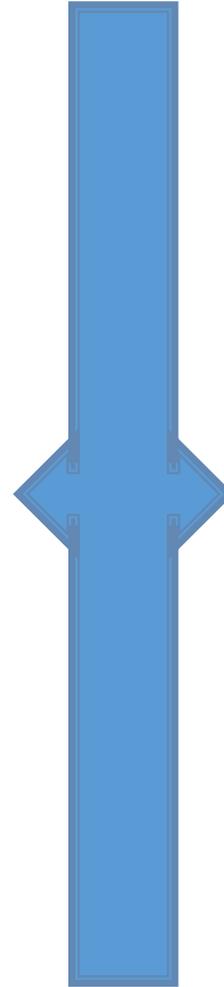

India potentially has more than a billion people or 40% of the OSS users who potentially need FSM services.

# IMPORTANCE OF CHARACTERISATION

WIPERS

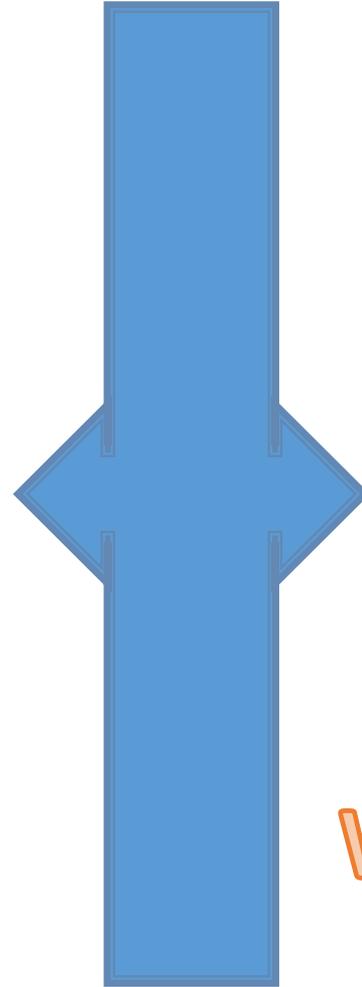

WASHES

# IMPORTANCE OF CONTEXT

DRY SLUDGES

WET SLUDGES -SEPTAC

# What we know now

- No two faeces are the same
- No two pits are the same
- Pits and materials are now homogenous across the depth
- Very little biological degradation occurs in pits
- Rheology varies across the pit depth
- Wet mass more easy to desludge
- Wet mass more expensive to transport

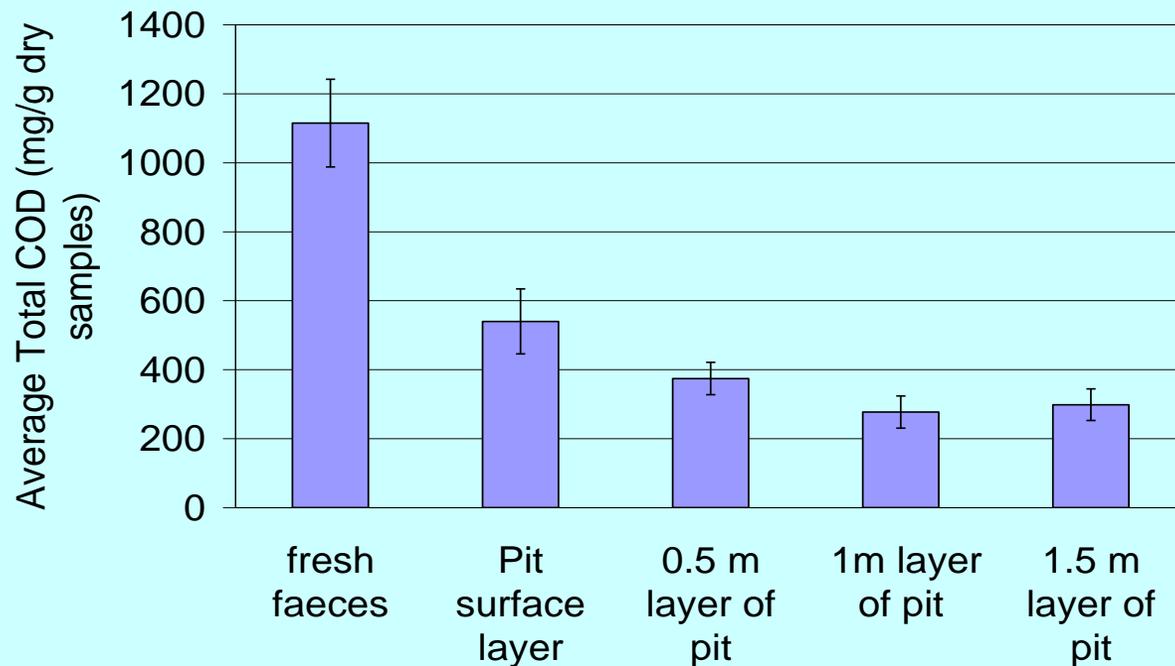

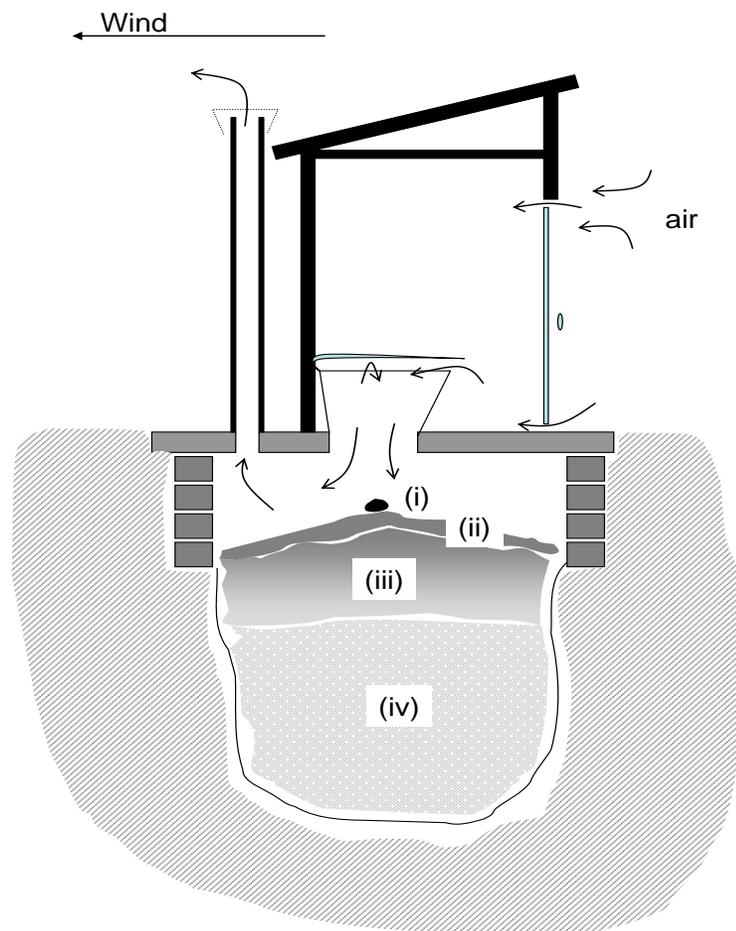

# CHALLENGES

- pits filling faster than design
- access to pits is a challenge
- pit desludging is expensive
- desludging poses risks
- material is not safe and stable
- airborne pathogens
- naivety of O&M
- solid waste – flying toilets
- systems seen from a civil engineering and project management perspective
- no holistic management
- focus on superstructure

# What happens in a pit?

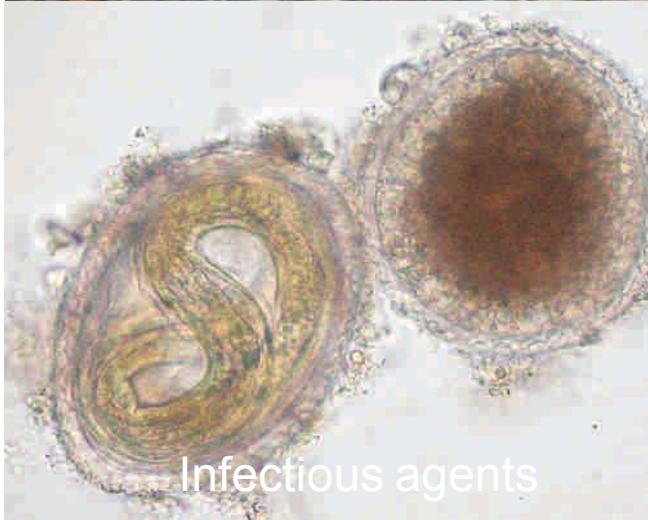

- fast degradation on top
- slows when covered
- very slow low down
- pathogens throughout the depth

# Pit Characterisation

Highly concentrated, varying wetness & trash content  
 1 VIP = 1 Megalitre of normal sewerage

Infectious agents

|   | Pit latrine sludge         | High strength sludge from bucket latrines and public toilets | Low strength sludge from septic tanks | Sewage – in waterborne sewerage systems |

WATER RESEARCH COMMISSION

# Challenges

Pit emptying is messy and a hazard to health

# Policy requirements – *‘THE ENABLER and PROTECTOR’*

*National policy and legislation that specifically deal with faecal sludge management.*

*Fragmentation - Aligning policy and legislation across different government departments.*

*Not a technical problem, but governance failure*

- Enabling the legal, institutional, policy, financing and other constraints to service delivery

- Institutional
- Health and Safety
- Regulation and standards
- Job Creation
- Environmental
- Public awareness and social marketing
- Financing
- Monitoring compliance
- Promoting Innovations

# POLICY REQUIREMENTS

- *A uniform standard.*
- *WASH campaigns that include educating children and adults (males and females) to be responsible and hygienic toilet users and cleaners.*
- *The sanitation value chain*

## TECHNICAL STANDARDS

- Emptying technology
  - Transport or conveyance
  - Safe treatment and disposal
  - Handling
  - Proper septic tank design and construction
  - Septic tank desludging and septage transportation
  - Infrastructure for septage treatment and disposal
  - Reuse applications
- REGULATIONS
    - sludge quality
    - Reuse
    - Treatment requirements

# Research Support

- **Characterisation**
  - science
  - sludge accumulation
- **desludging techniques and management**
- **Improved toilet technologies**
- **Emerging contaminants**
- **Rapid Diagnostics and Guidelines for Fecal Sludge Management**
  - Practical rapid diagnostic and advocacy tools
  - Economic analysis of options
  - Guidelines for program design and implementation
- **Re-use options**
- **Public health risk assessment**
- **FSM demand analysis**
  - Tool to estimate quantity and composition of sludge
  - Challenging due to wide variability
  - Needed in order to plan FSM services
- **Economics of Sanitation FSM**
  - Estimates impact of poor/absent FSM services
  - Allows for comparison of options, including sewerage
  - Cost-benefit and affordability estimation
  - Helps identify financing packages
  - Estimates market volume
  - Funding flows

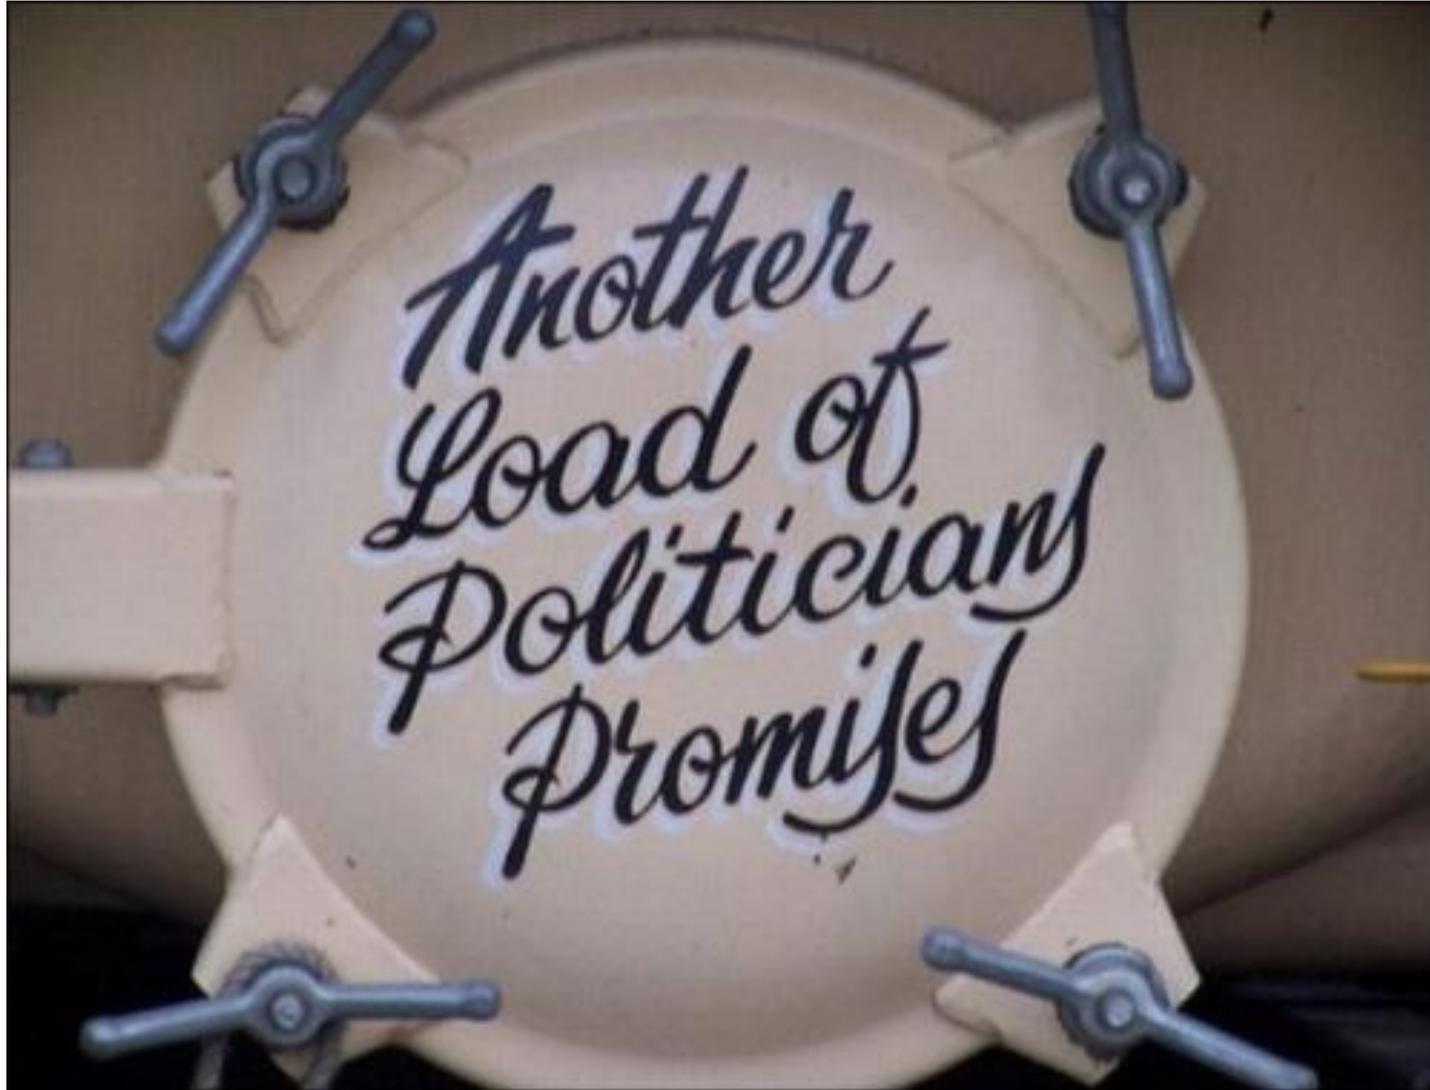

# Proposed SDG targets

- **Target 1:** By 2025, no one practices open defecation, and inequalities in the practice of open defecation have been progressively eliminated
- **Target 3:** By 2040, everyone uses adequate sanitation when at home, the proportion of the population not using an intermediate drinking water supply at home has been reduced by half, the excreta from at least half of schools, health centers and households with adequate sanitation are safely managed, and inequalities in access to each of these services have been progressively reduced
- **Target 4:** All drinking water supply, sanitation and hygiene services are delivered in a progressively affordable, accountable, and financially and environmentally sustainable manner.

THANK YOU!!!!!!!!!!!!!!!
