Sustainable solid waste management is one of the primary responsibilities of any city government. Local governments are expected to methodically and wisely plan, implement and monitor all the services concerning municipal solid waste management - from collection, treatment and processing to disposal. But limited financial, technical and infrastructural resources has meant that these local governments and cities are constantly stretched and under stress.

As part of its ongoing collaboration with the Government of Tanzania and the Tanzanian people, Centre for Science and Environment (CSE) is announcing a two-day online training programme – exclusively designed for city officials and urban managers from Tanzania -- on solid waste treatment, landfill management and dumpsite remediation. This training is aimed at institutional capacity building and developing technical knowledge. Subject experts and solid waste management practitioners will hand-hold the participants through the training programme, which will largely focus on issues and concerns faced by developing economies.

We look forward to participation by Tanzanian municipal officials and to fruitful interactions with them in this training.
