The provision of safe water, sanitation and hygienic conditions is essential to protect human health during all infectious disease outbreaks, including the COVID-19. To address this, water and sanitation safety planning plays a vital role, being a risk based management tools highlighting the integration of the health sector and helps to bring a human health perspective to traditional non-health sectors like water services and sanitation engineering.

This online course aims to create change-agents who will have basic understanding about the concepts and principles of Sanitation Safety Planning (SSP) in order to ensure safe water and efficient management of sanitation services.

**THEMES**

- Linkage between water, sanitation and health: Current and future challenges
- Enabling environment for improved water and sanitation for all
- Tools and approaches for better water and sanitation planning and progress
- Water and sanitation safety planning: Risk based approach to protect public health
