

**Stormwater Harvesting in Parks and Open Spaces: Experiences from India**

**Dhruv Pasricha, Deputy Programme Manager, Urban Water; [dhruv.pasricha@cseindia.org](mailto:dhruv.pasricha@cseindia.org)**

# Structure of Presentation

*This presentation will give you all a quick overview of CSE's WSUDP approach, and research on stormwater harvesting in parks and open spaces.*

- Why WSUDP and GI?
- CSE's research – Moving towards WSUDP and Green Infrastructure
- WSUDP for Climate Resilience
- Stormwater Harvesting in Parks and Open Spaces
- Case studies: Delhi, Uttar Pradesh
- Way forward

# Co-existence of Water Problems - Shortage & Abundance

No city has 24x7 water supply

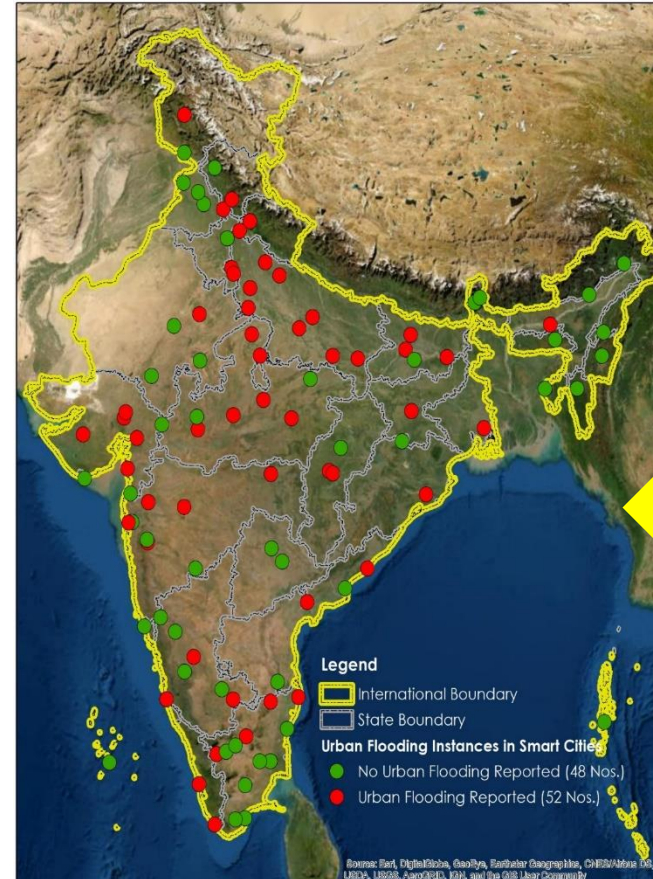

**Groundwater Exploitation,**  
More recharge –  
40 % India falls under dark zone

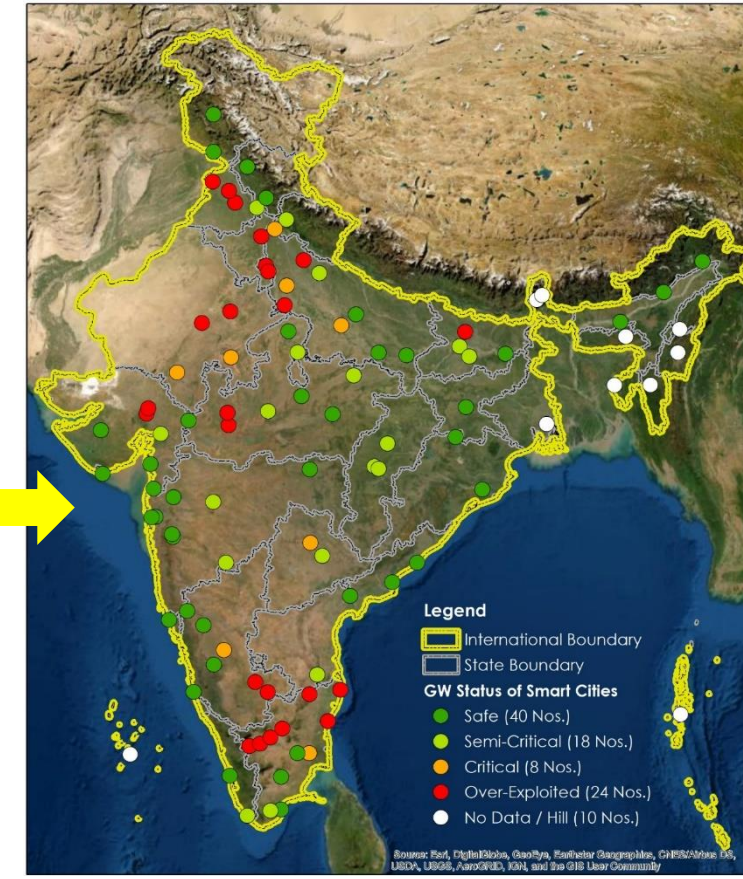

Drainage  
Scenario

## Urban Flooding Incidences & Status of Groundwater

Urban Flooding Incidences

Status of Groundwater

Emerging Urban Scenario

# Urbanisation and Increase in Built up Area

Largest cities **significant population and built up** area both are **outside ULB** boundaries

Most cases proportion of **built up area** is **greater** then the **population outside administrative boundaries** implying low density sprawl

**Land /city development** process that takes more than **two decades** or even **more**

**Spatial expansion** has **accelerated** in top **ten** largest cities from 2000-10

**Built up density** is **decreasing** for most of **core** areas of largest ten cities

Evolution of **density outside ULB** boundaries varies more, but is **less** then city cores.

Source: Aromar Revi 'Urban India 2011 - Evidence, IIHS Publication (2012)

***Built up area has been growing faster than population in nearly all of India's the largest cities in past two decades.***

# Climate Change?

CLIMATE CHANGE

## Wet century ahead: Extreme rainfall here to stay for Western Ghats, North East

Extreme rainfall events have become more frequent since the 1980s, the analysis noted

# Natural Catchment v/s Urban Catchment

## Natural catchment

## Urban catchment

Urban development can be planned and executed so as to **lower the hydrological impact of urbanization by using current opportunities** to increase the carrying capacity of the area in terms of **improved water management**

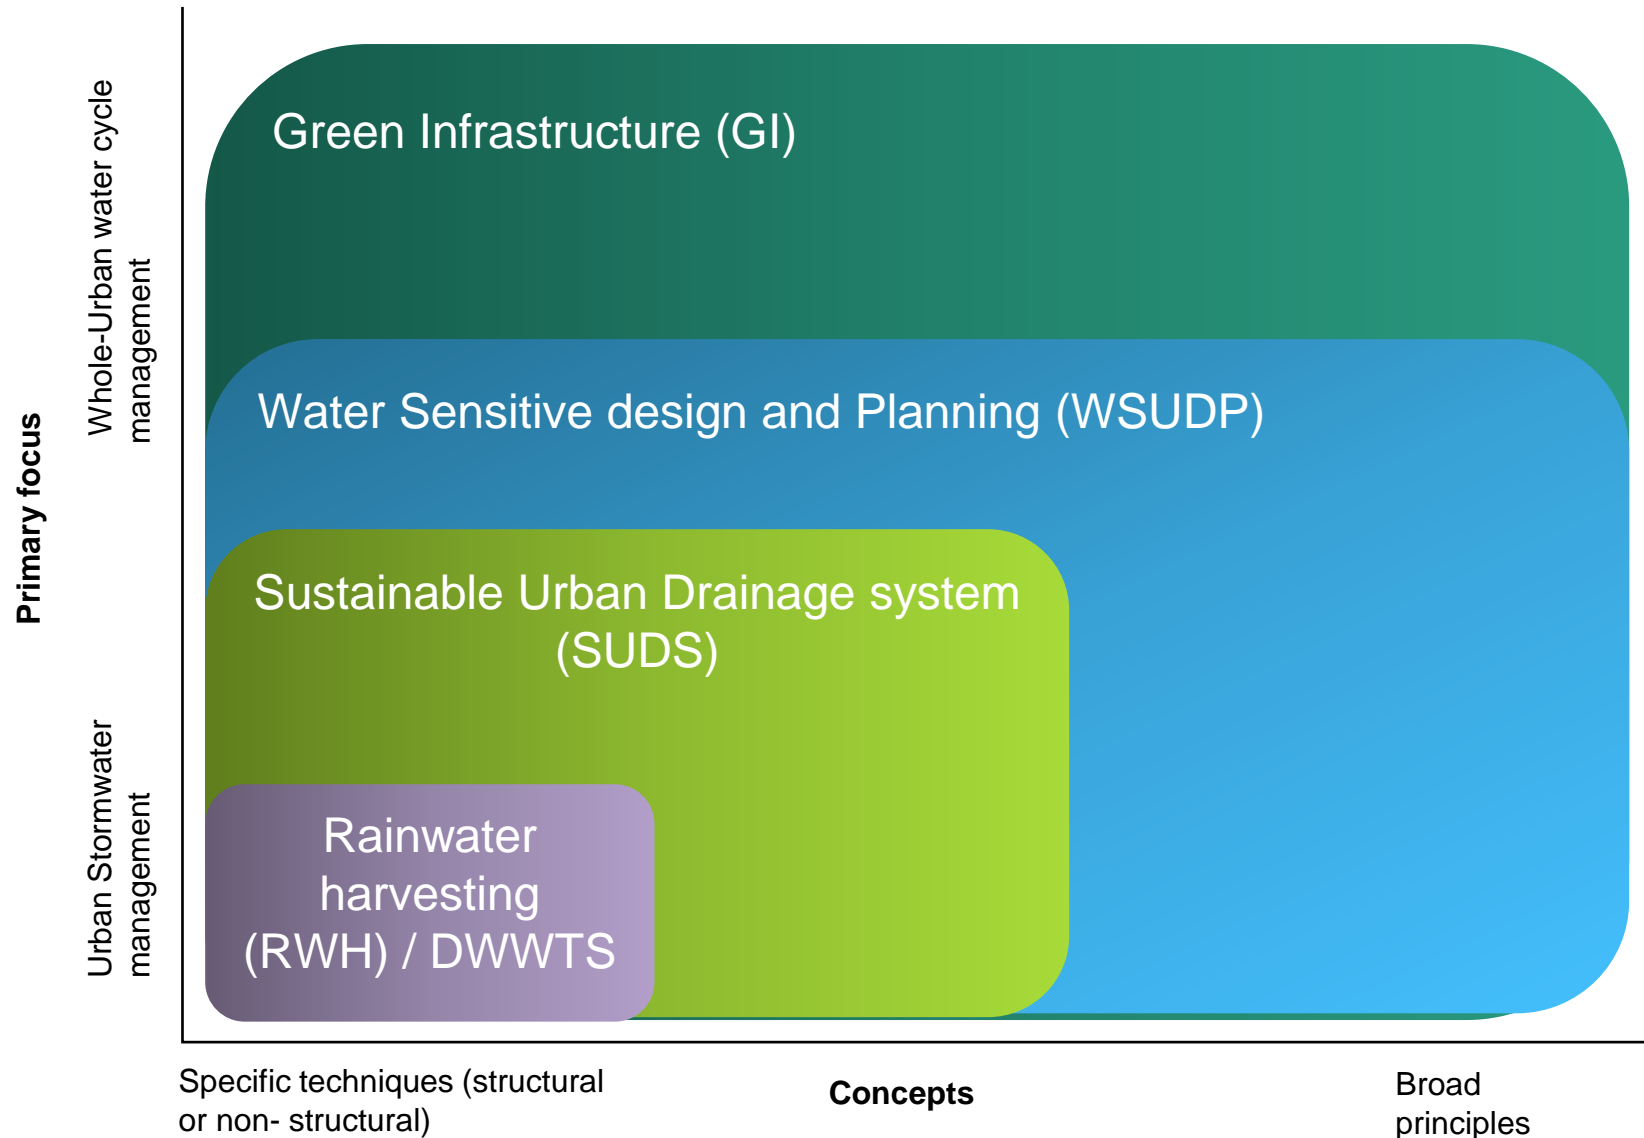

# CSE Research: Mainstreaming WSUDP in India - Policy & Practice

# WSUDP, GI and other overlapping terms

All terms are generally underpinned by two broad principles:

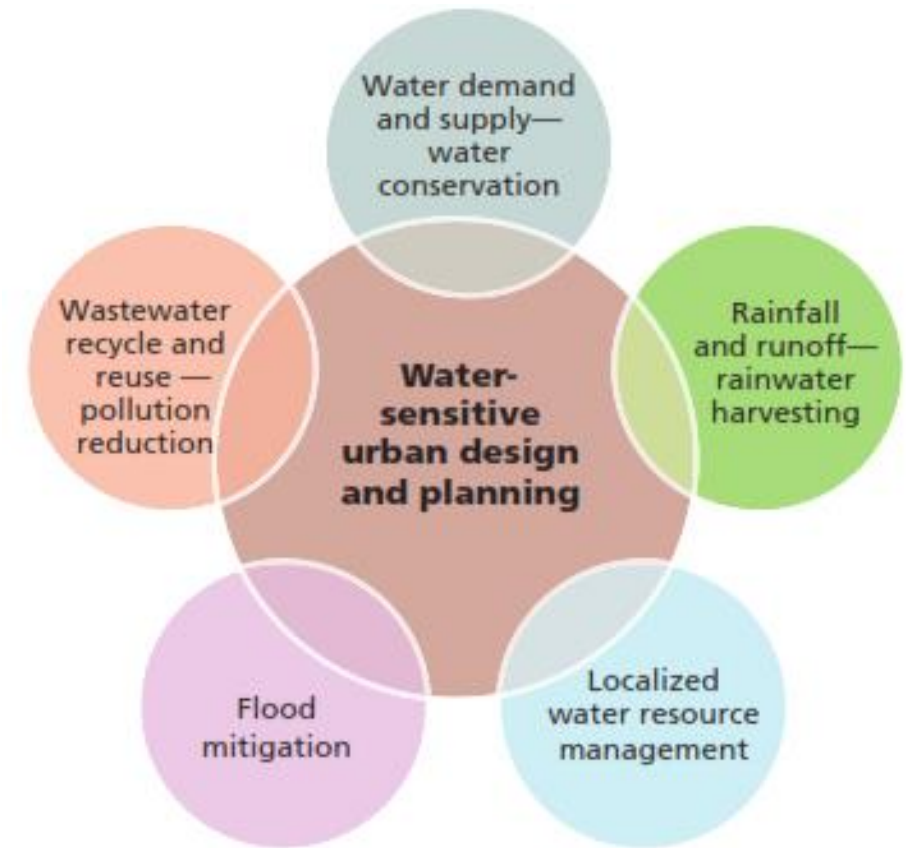

- 1) Mitigation of changes to hydrology and evolution towards a flow regime as much as feasible towards natural levels or local environmental objectives
- 2) Improvement of water quality and a reduction of pollutants.

# What is WSUDP? CSE believes...

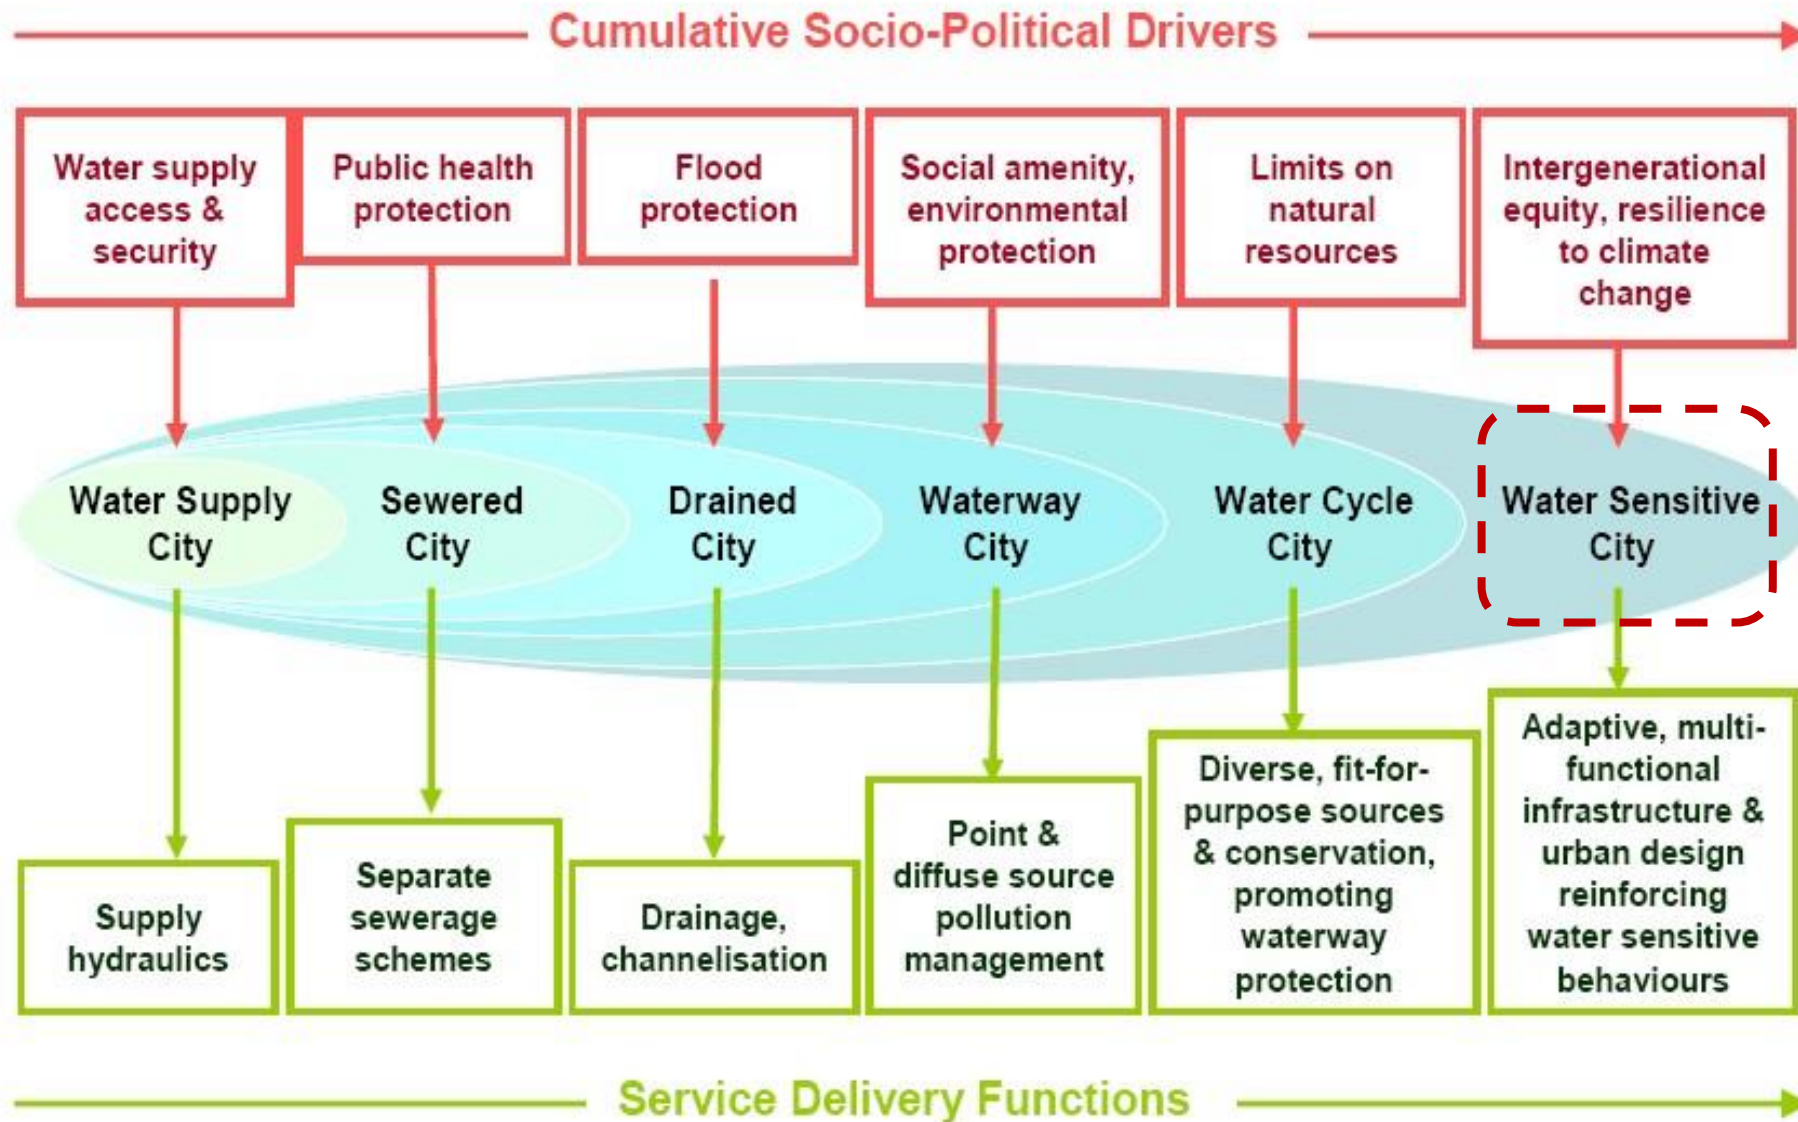

- Protecting local water bodies (lakes, ponds and wetlands) for supplementary water sources
- Storm-water management at public places, including open areas in cities
- Recycling and reusing wastewater naturally (low cost/low energy) and not treating it as a liability
- Increasing water-conservation approaches at various scales (buildings/campus). On-site water conservation with rainwater harvesting (RWH) is important to reduce water scarcity.
- Adding value to the social and ecological aspects of areas by planning and designing the built environment in accordance with community needs and water issues
- Connecting the urban water cycle by collaborating with practitioners of different disciplines to bring different perspectives and expertise
- Associating upcoming policies, regulations and approvals with WSUDP.

**WSUDP is an approach that integrates and optimizes the use of available water sources and completes the water cycle by incorporating the following in planning and designing.**

## Integrating water-cycle management

# What is WSUDP? CSE believes... social and service delivery

Source: Wong and Brown, 11th International Conference on Urban Drainage, Edinburgh, Scotland, UK, 2008

# Conventional Practice v/s WSUDP Approach

| Conventional approach  | WSUDP approach |
|--|----------------|
| <b>Fragmented approach:</b> Integration is by accident. Water supply, wastewater and storm water may be managed by the same agency as a matter of historical coincidence but physically the three systems are separated. |                |
| <b>Linear urban water cycle:</b> Water follows a one-way path from supply, to a single use, to treatment and disposal to the environment.  |                |
| <b>Increased demand:</b> Increased demand is met through investments in resources and centralized infrastructure leading to leakage losses. Water of potable quality is supplied for all uses.                           |                |
| <b>Storm water as nuisance:</b> Storm water is conveyed away from urban areas as rapidly as possible.  |                |
| <b>Bigger/centralized is better:</b> To get water from distant source and then to treat wastewater at far places, thereby increasing the overall infrastructure.   |                |

*Comparison between conventional practice and WSUDP lists the currently practised and WSUDP approaches for managing urban water resources.*

# Different scales for implementing WSUDP

## Regional

(Medium density: more than 400-400 persons per hectare (pph), catchment...)

## City/ Zonal

(Medium density: 200–400 persons per hectare (pph), commercial areas...)

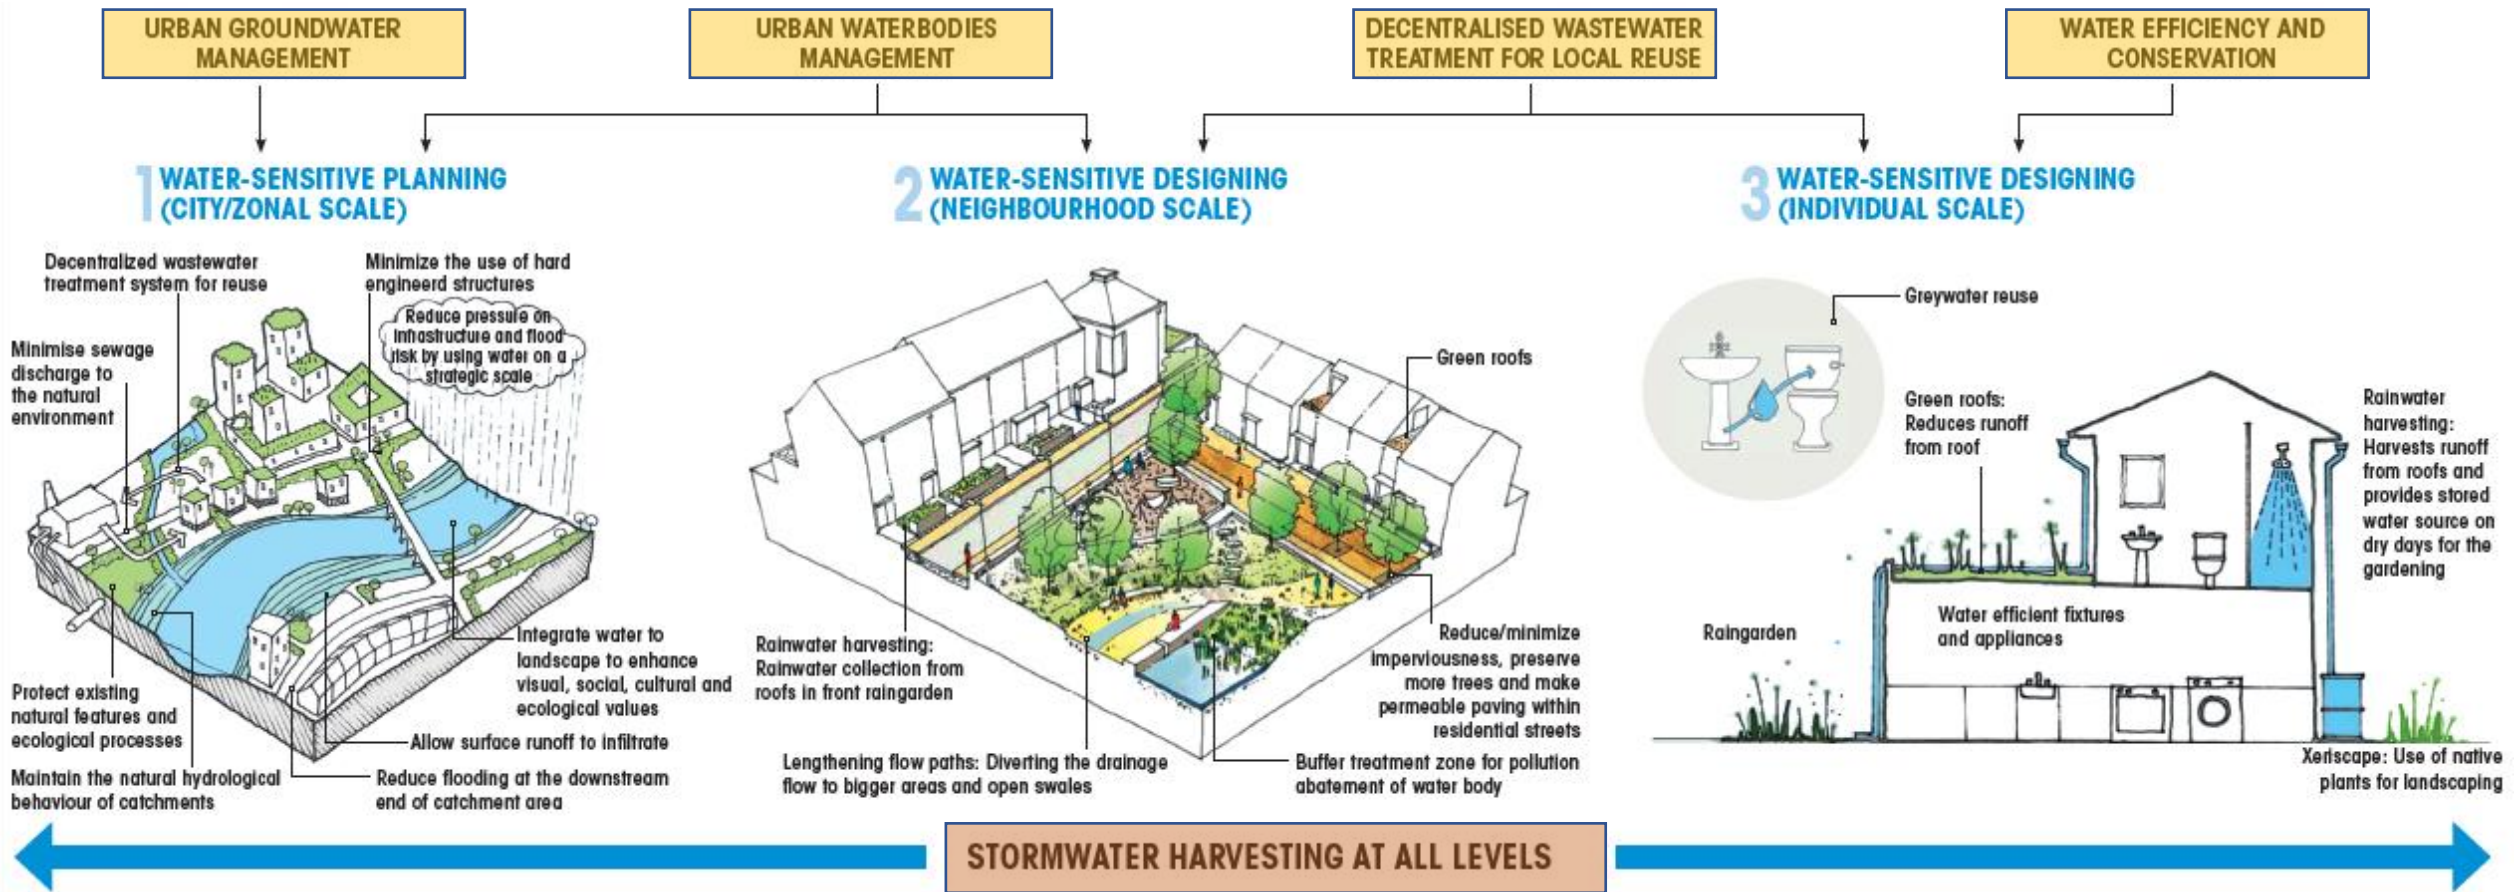

## Neighbourhood

(Institutional/ commercial buildings/ Residential Complexes)

## Individual

(Residential buildings (plotted/ four– five storied))

# WSUDP – Concept and Approach

## Decentralized Water Management

**WSUDP** is an approach that **integrates and optimizes the use of available water sources** and completes the water cycle by incorporating the following in **planning and designing**. This approach contributes to **sustainability and liveability**, particularly when considered part of an overall urban strategy.

# Scope of interventions as per existing provisions

The residential cluster, which occupies the largest share of land use in city and towns, contains building rooftops, sidewalks, paved parking spaces, pervious areas that could be a garden or just open land and accessible roads.

Land-use pattern for different urban centres of India

Ratio of built-up to open area in different land uses

The average Built up area range for a city/urban area is 21-26% while for open space, it is 74 - 79 %. The standards and guidelines provide enough open area to design the SUDS structures

# Scope of interventions as per existing provisions

# Components of water-sensitive urban design and planning

| Sustainable water management |                          |                            |                                 |  | Urban planning               |                             |                         |                           | Landscape design          |                              |
|------------------------------|--------------------------|----------------------------|---------------------------------|--|------------------------------|-----------------------------|-------------------------|---------------------------|---------------------------|------------------------------|
| Ensure water supply          | Manage storm water       | Treat/ recycle waste-water | Ensure/ improve waterway health | Protect surface water-bodies and groundwater | Consider ecological demands  | Consider economical demands | Consider social demands | Consider cultural demands | Provide aesthetic quality | Contribute to cities amenity |
| Engineers                    | Environmental scientists |                            | Environmental planners          |  | Urban and landscape planners | Administrative officers     | Architects/ engineers   |                           | Landscape architects      | Urban designers/ architects  |
|                              |                          |                            |                                 |  |                              |                             |                         |                           |                           |                              |

Multidisciplinary but also interdisciplinary

Integration for Sustainable Urban Development.

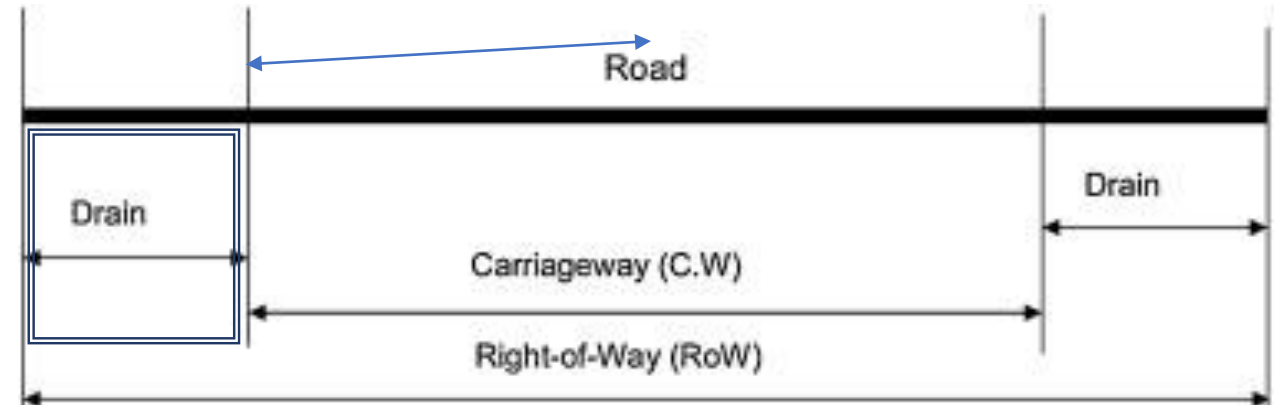

Integration along levels of planning

WSUDP integrates water cycle management with the built environment through planning and urban design, providing multiple benefits and opportunities in order to overcome challenges with water management

# Conventional Drainage Design

- Storm drains on both sides of the road
- Connected with cross drains across the road at suitable intervals having gratings to collect rain water from surface of the road during rains
- Drains for removal of stormwater runoff from the carriageway, just to avoid water logging

## CPHEEO recommended Design Return Periods for various urban sub-catchments

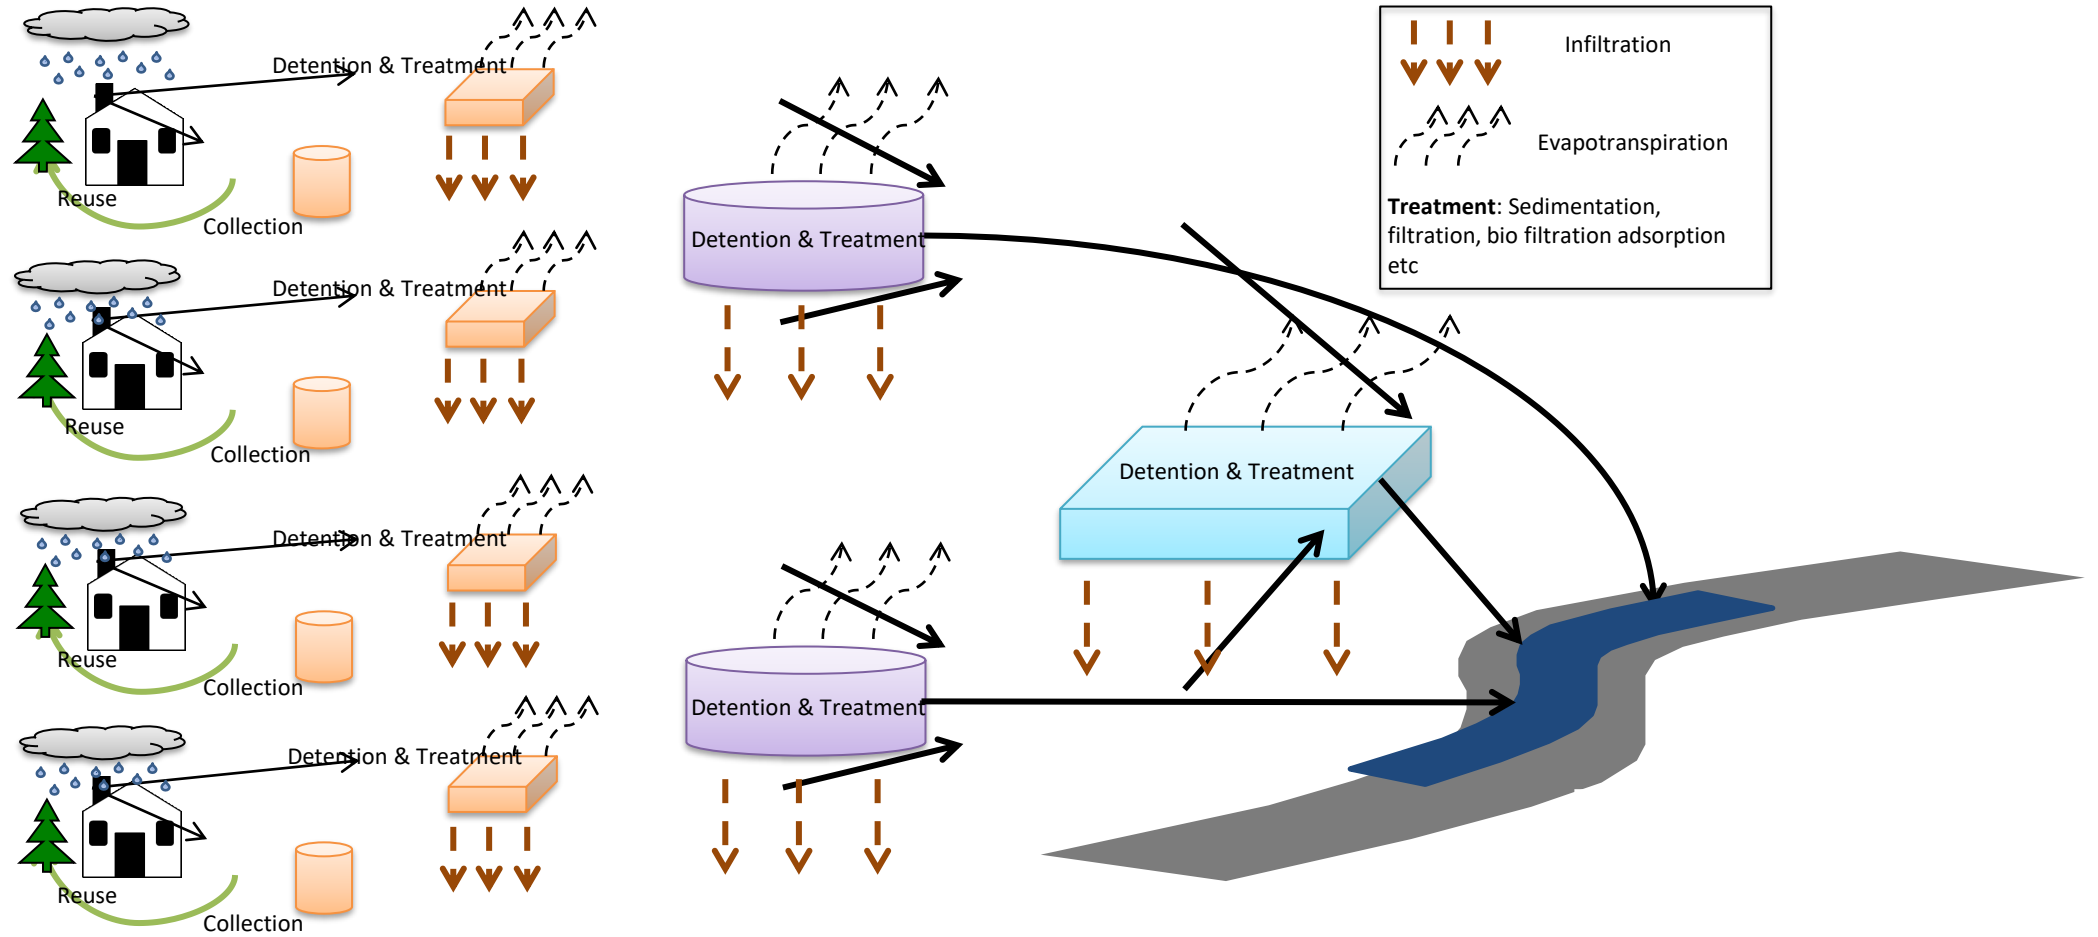

| S. No. | Urban Catchment                                    | Return Period                      |                                    |
|--------|--|------------------------------------|------------------------------------|
|        |  | Mega Cities                        | Other cities                       |
| 1.     | Central Business and commercial                    | Once in 5 years                    | Once in 2 years                    |
| 2.     | Industrial   | Once in 5 years                    | Once in 2 years                    |
| 3.     | Urban Residential<br>Core Area,<br>Peripheral Area | Once in 5 years<br>Once in 2 years | Once in 2 years<br>Once in 1 years |
| 4.     | Open space, Parks and<br>landscape                 | Once in 6 months                   | Once in 6 months                   |
| 5.     | Airports and other critical<br>infrastructure*     | Once in 100 years                  | Once in 50 years                   |

\*critical infrastructure includes Railway Stations, Power stations, etc.

As per IRC: SP:42- 2014 road side drains It must **drain the surface and subsurface water away from the roadway** and dissipate it in a way that **prevents the excessive collection of water** in unstable areas and subsequent downstream erosion

The design return periods are inadequate for extreme rainfall. How can we augment these systems?

# SUDS Train

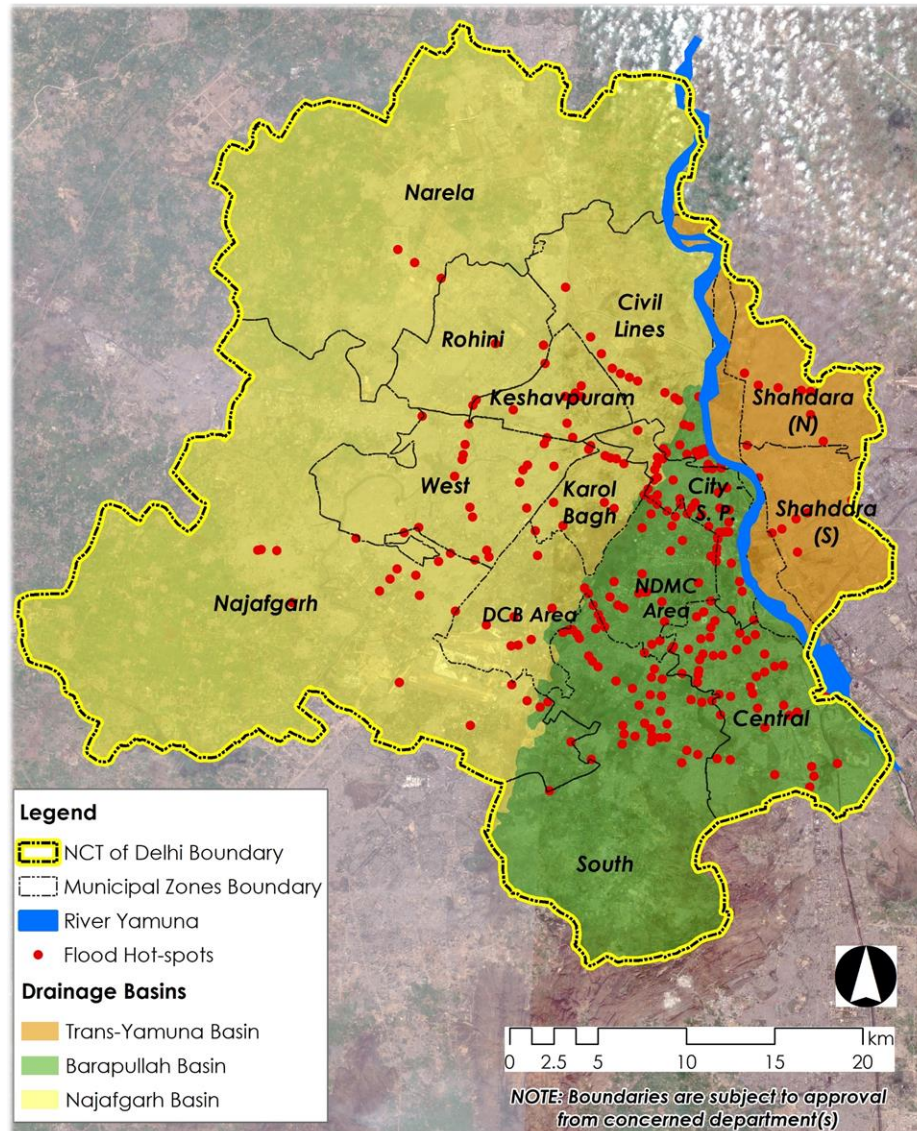

# Roadmap Series: Stormwater Harvesting in Parks and Open Spaces

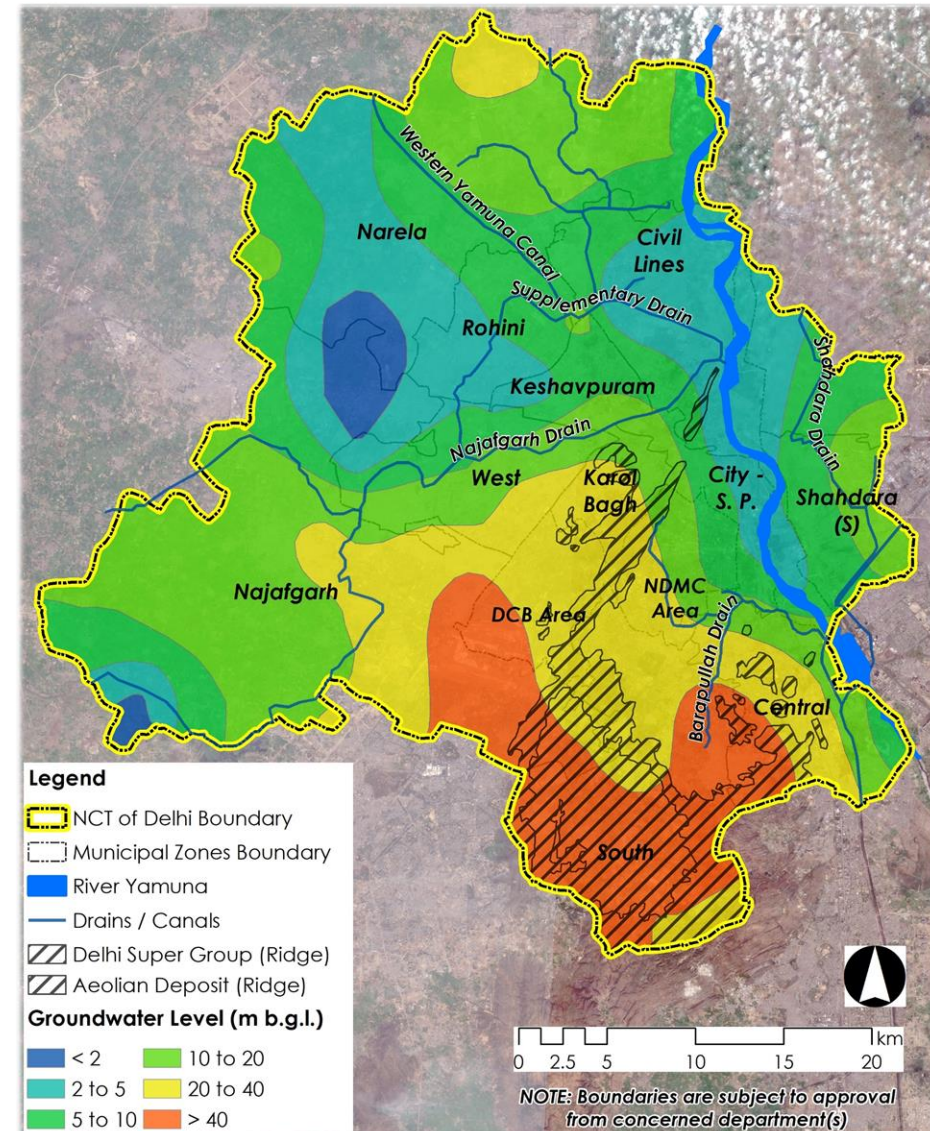

# Stormwater Harvesting: NCT of Delhi

Delhi | Pop.: 25 million | Area: 1,483 sq. km.

161 'official' flood hotspots identified

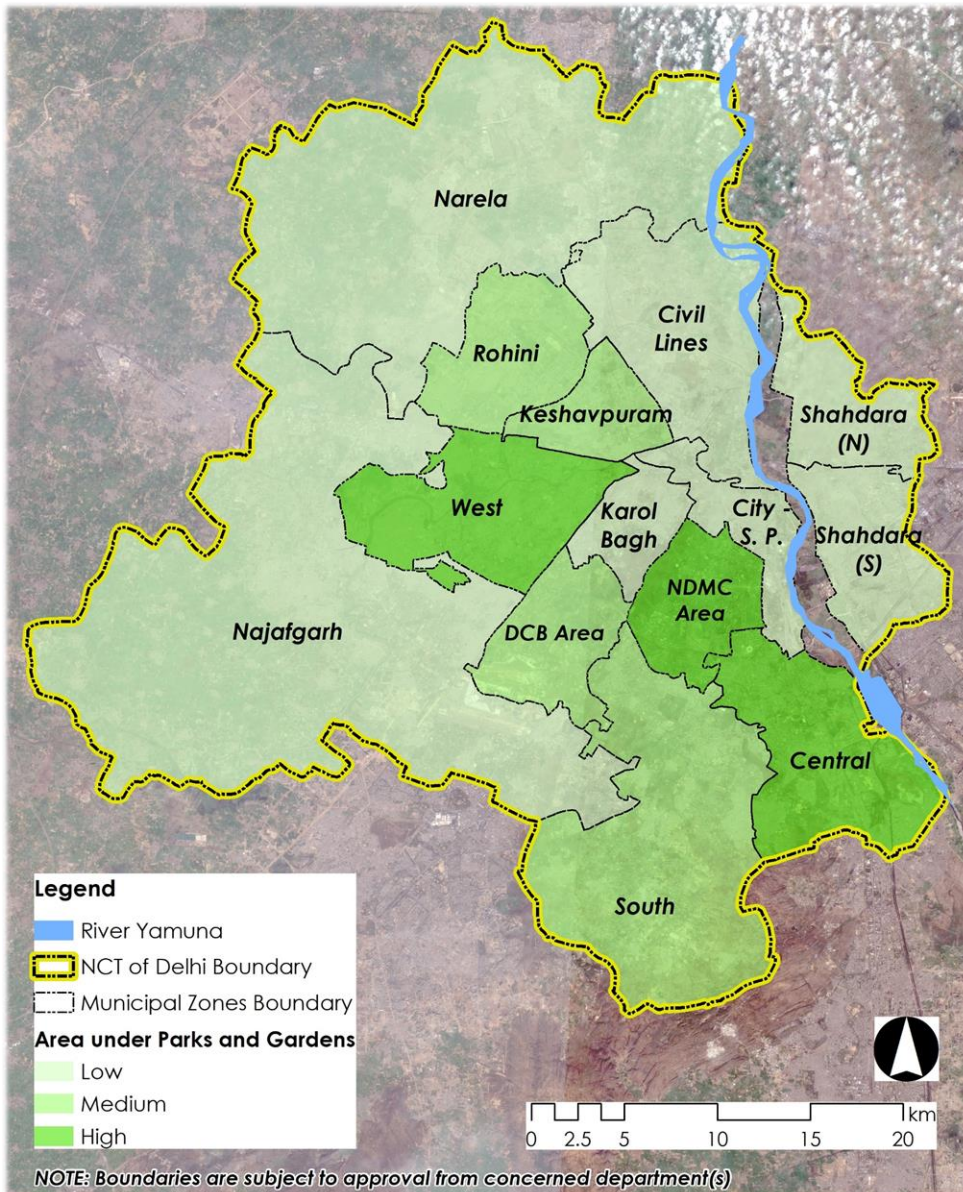

Groundwater levels at 40 m b.g.l. in 30% of the city, and further depleting.

# Stormwater Harvesting: NCT of Delhi

16,299 Parks in Delhi

## INDICATORS

Area under parks

Post-monsoon groundwater level

Soil type, Geology

Flood hot-spots, areas vulnerable to flooding

### Neighbourhood Parks

|                                  |       |
|----------------------------------|-------|
| Total Park Area (Ha)             | 1,864 |
| Annual Potential Run-off (Mil L) | 2,384 |
| Area of WSUDP interventions (Ha) | 28    |

### Community Parks

|                                  |      |
|----------------------------------|------|
| Total Park Area (Ha)             | 647  |
| Annual Potential Run-off (Mil L) | 828  |
| Area of WSUDP interventions (Ha) | 10.4 |

### Regional Parks

|                                  |     |
|----------------------------------|-----|
| Total Park Area (Ha)             | 165 |
| Annual Potential Run-off (Mil L) | 211 |
| Area of WSUDP interventions (Ha) | 3.3 |

**Total WSUDP Potential (Mil L) 3,423**

Missed potential which sometimes becomes liability in the city. If managed efficiently, the same runoff can be stored, recharged and moderated during peak rainfall.

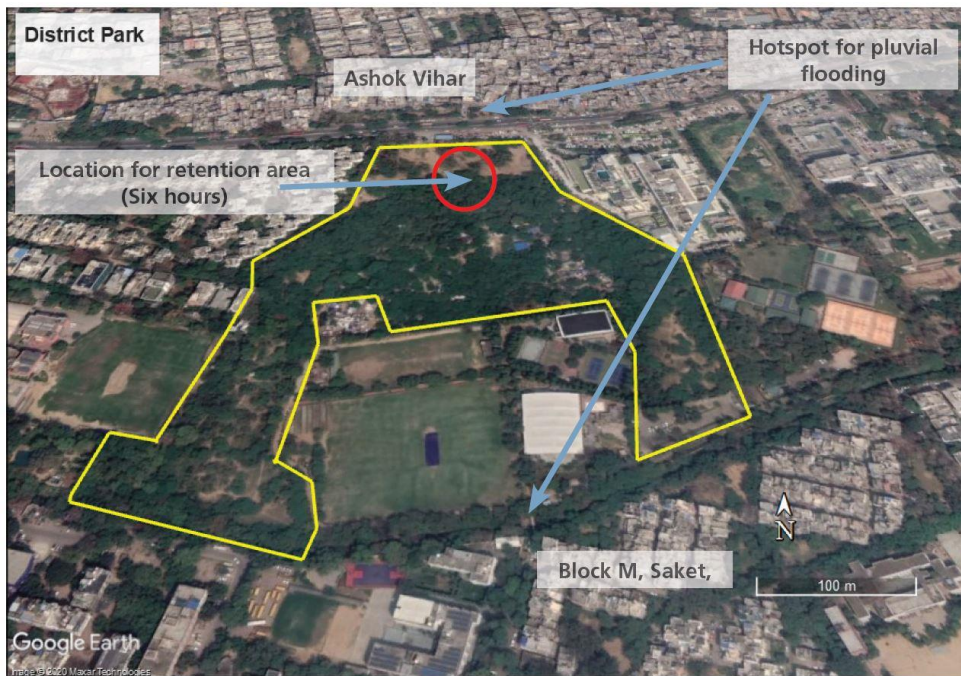

Delhi has more than 8,000 Ha of area under natural and planned greens, having an estimated annual stormwater harvesting potential of 12,800 Mil L.

# Stormwater Harvesting: NCT of Delhi

Three pilot parks identified as flood sinks, based on the vicinity to flood hotspots. Details:

- Cumulative stormwater harvesting potential: **59,000 KL**
- Structures: rain-garden, bio-retention area, swale, infiltration basin
- Area: **2-5% of total park area** | Average depth: 2 m
- Implementation: Urban Local Body | O&M: Residents Welfare Association
- **No. of flood hot-spots addressed: 7**

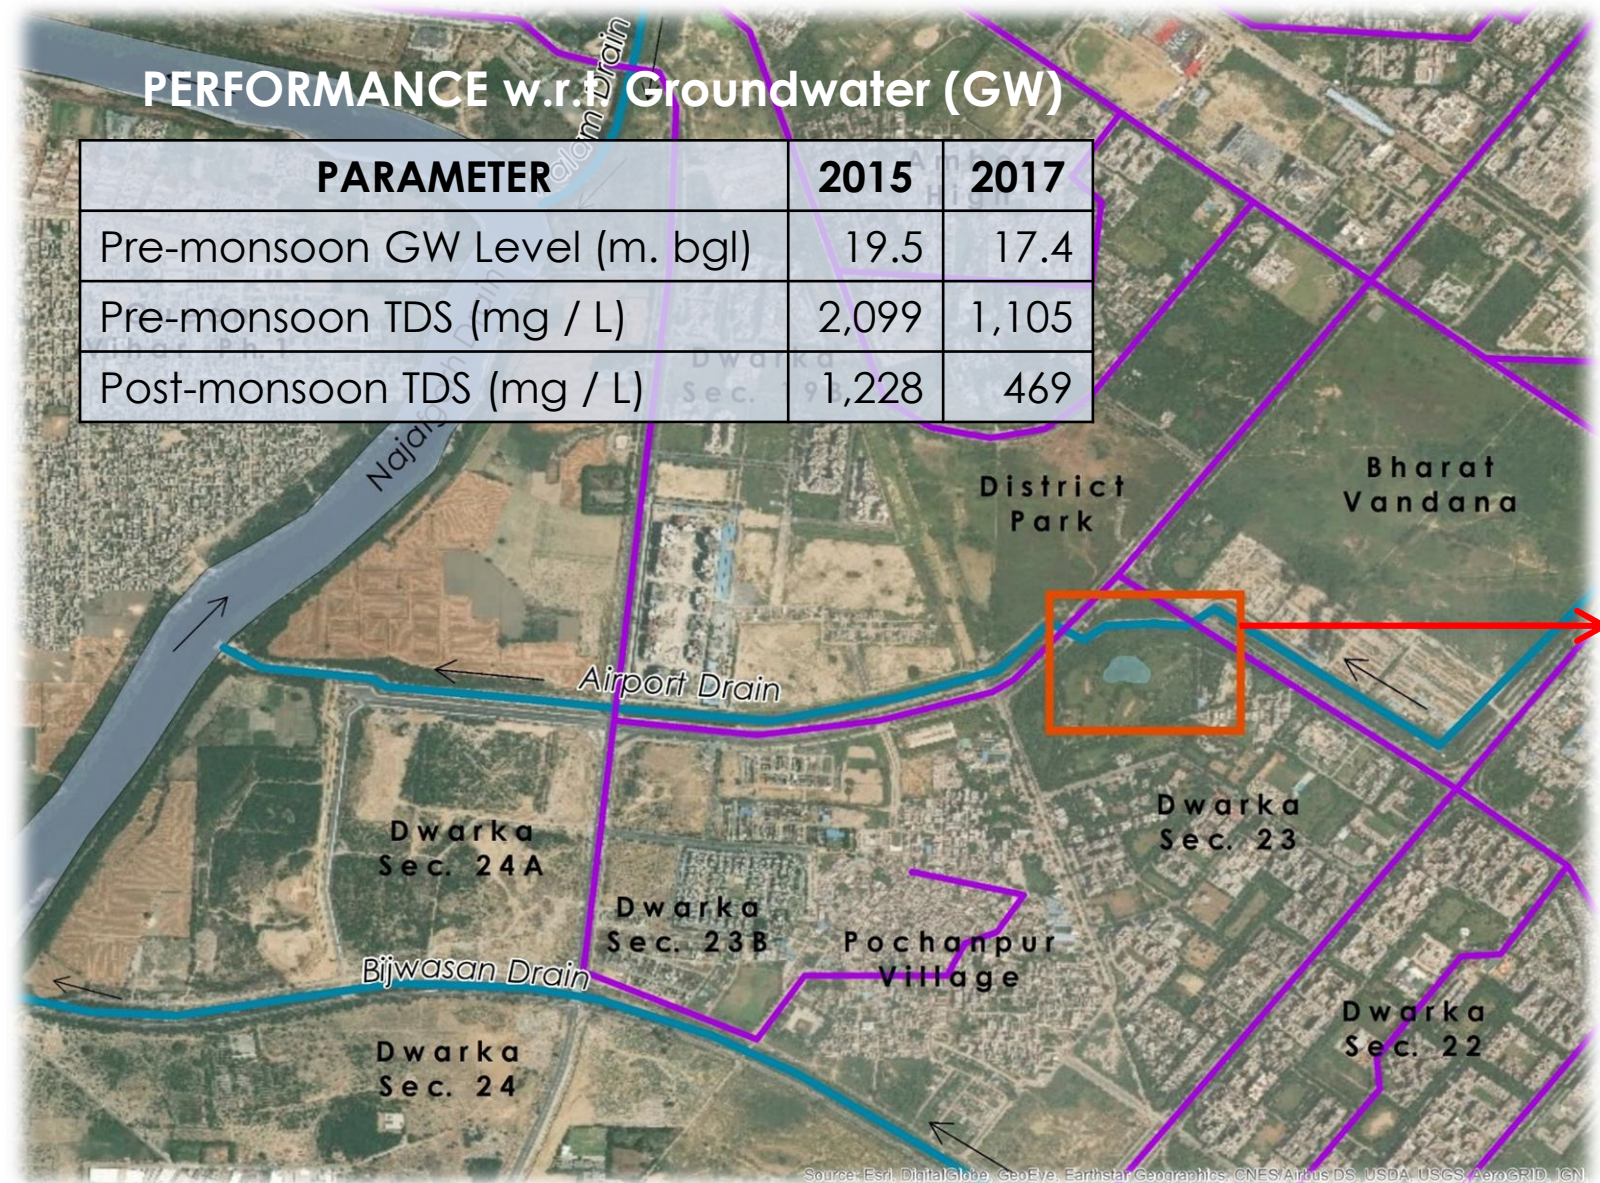

# Stormwater Harvesting: NCT of Delhi

## PERFORMANCE w.r.t Groundwater (GW)

| PARAMETER                     | 2015  | 2017  |
|-------------------------------|-------|-------|
| Pre-monsoon GW Level (m. bgl) | 19.5  | 17.4  |
| Pre-monsoon TDS (mg / L)      | 2,099 | 1,105 |
| Post-monsoon TDS (mg / L)     | 1,228 | 469   |

Area: 1.6 acres | Depth: 8-10 feet | Capacity: 1.9 mil L

## Status of Urban Water Challenges in the cities

- Status of Groundwater exploitation
- Urban Flooding issues
- Loss of Water bodies
- Swachh Sarvekshan Score 2020

## 5 Selected Smart Cities

Different hierarchical parks and open spaces of neighbourhood scale and zonal or city scale have been selected as pilot case studies

## Methodology for selection of cities for Pilot Projects

| City             | Pop. - 2011 (in Lakhs) | Master Plan | Swachh Sarvekshan, 2020 Rank | Groundwater Status (as per GEC-2015) | Urban Flooding | Loss of Waterbodies |
|------------------|------------------------|-------------|------------------------------|--------------------------------------|----------------|---------------------|
| <b>Lucknow</b>   | 29.02                  | Yes         | 12                           | Over – Exploited                     | Yes            | Yes (46 %)          |
| <b>Kanpur</b>    | 28.76                  | Yes         | 25                           | Over – Exploited                     | Yes            | Yes                 |
| <b>Varanasi</b>  | 11.98                  | Yes         | 27                           | Over – Exploited                     | Yes            | Yes                 |
| <b>Prayagraj</b> | 11.95                  | Yes         | 20                           | Over – Exploited                     | Yes            | Yes                 |
| <b>Moradabad</b> | 8.78                   | Yes         |                              | Over – Exploited                     | Yes            |                     |

## Stormwater Harvesting: Uttar Pradesh

| City  | Area under Parks (Ha) | WSUDP Potential (Million L) |
|---|-----------------------|-----------------------------|
| Lucknow   | 259                   | 309                         |
| Kanpur  | 260                   | 305                         |
| Varanasi  | 776                   | 971                         |
| Prayagraj   | 140                   | 166                         |
| Moradabad   | 725                   | 873                         |
| Total   | 2,160                 | <b>2,624</b>                |
| <p><b>2,624 million litres</b> run-off quantity is the missed potential<br/>which sometimes become a liability in these cities.</p> <p>If managed efficiently, the runoff can be stored, recharged and moderated during<br/>peak rainfall</p> |                       |                             |

## Stormwater Harvesting: Lucknow, Uttar Pradesh

| Park                             | Dr Ram Manohar Lohia Park   | Neighbourhood Park, LDA Colony  | Indira Park  |
|----------------------------------|---|---|--|
| Area (sq. m.)                    | 2,82,047  | 18,008  | 5,227  |
| Scale                            | Sub-City  | Community   | Neighbourhood  |
| Annual RWH Potential (KL)        | 32,760  | 2,092   | 607  |
| Recommended Structure(s)         | <ul style="list-style-type: none"> <li>• Swale</li> <li>• Trench with filter strips</li> <li>• Bio-retention Area</li> <li>• Detention Basin</li> <li>• Infiltration Basin</li> </ul> | <ul style="list-style-type: none"> <li>• Swale</li> <li>• Bio-retention Area</li> <li>• Trench with Filter Strips</li> <li>• Infiltration basins</li> </ul> | <ul style="list-style-type: none"> <li>• Swale</li> <li>• Raingarden</li> <li>• Trench with Filter Strips</li> </ul> |
| Total Area of Structures (sq. m) | 3526 to 4512.7  | 225.1 to 288  | 65.3 to 83.6   |

- RWH structures require **1-3% of total area of Parks**
- **35.45 Mil L** can be harvested from these three parks annually
- Assuming **15 Neighbourhood parks** implement RWH in Lucknow, additionally **31.38 Mil L** can be harvested. **A total of 66.83 Mil L can be harvested annually**

As per CDP plan, 2041, Lucknow has 1,684 parks and gardens, spread across an area of 259 hectares, where stormwater harvesting can be implemented. Therefore, a **total of 309 million litres of rainwater can be harvested in Lucknow annually.**

The Locational details (along the geo- coordinates, if possible) ✓

Size of the Parks ( in Sq. Mts.) ✓

Topography- General gradient/ slope and orientation of the park ✓

The soil condition (information on the soil profile) ✓

The storm water drains existing in or near the parks ✓

RWH structures existing in or near the parks ✓

Rainfall data of the locality ✓

Data on Aquifers: Type of Aquifer, Depth ✓

Data on Groundwater Table, Groundwater Quality ✓

Nature and type of green cover inside the park ✓

Nature and extent of land covered by the water bodies, if any, inside the park ✓

Utilities commissioned inside the parks and open spaces ✓

Information on drinking water demand and Supply ✓

Mining activities, if any in Urban Areas ✓

# Options for Stormwater Harvesting in Parks

## Integrating different stormwater harvesting and infiltration management practices options

# Planning and Designing – Example for Detention Basin

Detention basins are surface storage basins or facilities that provide flow control through attenuation of stormwater runoff.

Provide temporary storage

controlled release of detained runoff

Can cater to frequent storm water events

The land may also function for recreational facility

Combination Filtration / Infiltration

# Planning and Designing – Example for Detention Basin

- Allow infiltration of surface water runoff to the ground
- Potential for dual land use
- Can cater to wide range of rainfall events
- Used for large sites

## Key design thumb rule:

- Length With ratio: 2:1
- Side slopes: 1:4 (shallow + gentle slope)
- Max water depth: 3m

## Can be used as:

- Playgrounds
- Recreational areas

Reference: CIRIA Manual 696

## Detention basin example

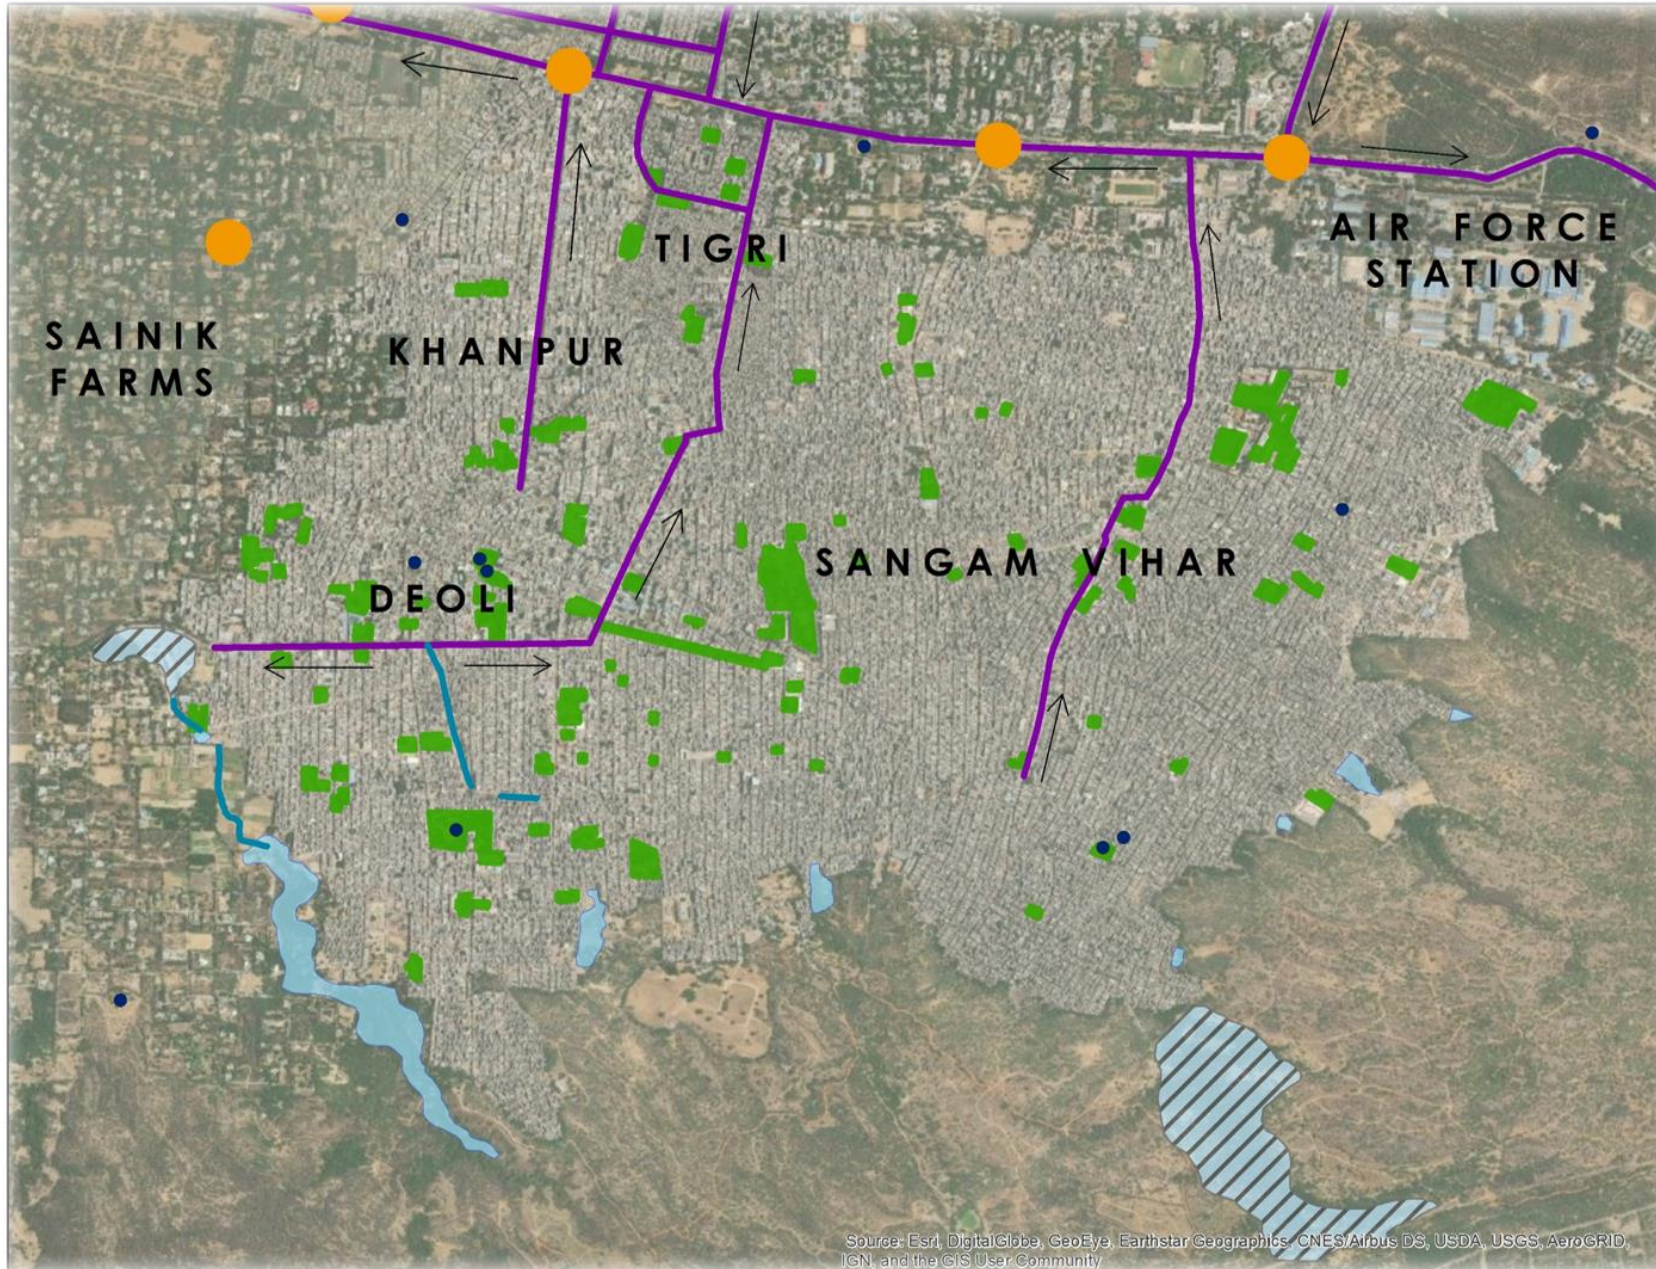

1. Grassed base of detention basin
2. Vegetated bank: opportunities for play whilst feature is dry
3. Native vegetation and naturalistic aesthetic creates exciting and dynamic landscape feature
4. Natural surveillance of amenity space as opposed to fencing off the facility

Location: Ipswich, UK

# Stormwater Harvesting in Unplanned Areas?

## Legend

- Stormwater Drain —→ Flow Direction
- Nallah
- Waterlogging (As reported by Delhi Police)
- Waterbodies (as per DPGS)
- Existing Water Body
- Water Body (as per Zonal Plan)
- Open Space

0 0.25 0.5 1 km

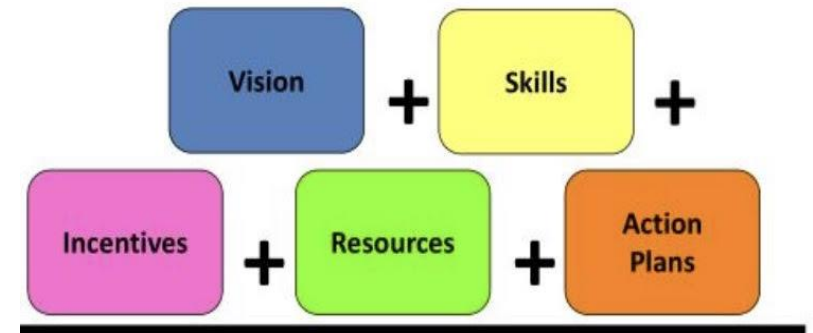

Combination of conventional drainage and harvesting in 'incidental open spaces', along natural topography.

# Roadmap for impact on ground: Managing complex change

## Managing Complex Change

**CHANGE**
